# The Best Saw Chain For Your Best Chainsaw!

CENTRI  LUBE™

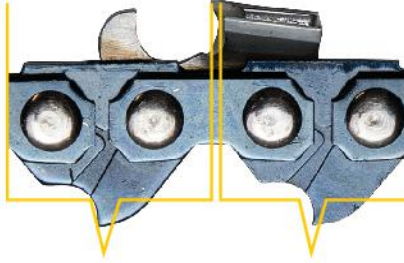

- ✓ DIY use
- ✓ Semi-Professional use
- ✓ Professional use

## How to choose the correct chain for your chainsaw

A. In order to choose the correct chain for your chainsaw, you need the information below:

### PITCH

The value of the distance between three in row link rivets divided by two. Must be of the same value as the bar and drive sprocket of your chain saw.

### DRIVE LINKS

Defines the needed length of the chain that you choose and is dependent on the bar and drive sprocket of your chain saw.

### GAUGE

According to the bar of your chainsaw, you must select the correct chain with the same drive link gauge as the width of the bar groove.

B. Choose the correct type of chain for the task you wish to undertake, according to the various cutter designs below:

### SEMI-CHISEL

Suited for general use, they provide high cutting speed and remain sharper for longer time. Easy to sharpen and ideal for consumer use.

### FULL-CHISEL

They provide low cutting resistance, clean cut, fast chip clearance and in general higher cutting speed and performance. Preferred by professional users and ideal for typical use in clean conditions.

### FOR PROFESSIONALS

### PRO CHAINS

Only suited for professional use. They provide higher cutting speed and cutting performance in clean conditions, as well as faster sharpening.

### UL CHAINS

They match the safety regulations according to ANSI standards towards lowering kickback danger levels. Best suited for consumer use since they provide extra low vibration levels and safety.

### LOW PROFILE (LP)

Suited for general use, with extremely low vibration levels, they provide high cutting quality. Ideal for use on chainsaws of low displacement.

### CENTRI LUBE

### CENTRI LUBE CHAINS

Specially designed channel on each guide link, pulls lubricating oil from the bar and distributes it on the rivets, reducing friction and increasing life expectancy of the chain.
